

REAL-TIME WEB COMMUNICATION PLATFORM

XPUSH 개발팀
(<http://xpush.github.io>)

2014.11.15

> For your REAL-TIME Services

Chatting

체팅 기능을 만드는데, 서버 개발을 할 시간이 없다.

Messenger

모바일 App, Desktop S/W, 웹브라우저 에서
모두 동작할 수 있는 메신저를 만들고 싶다

Dashboard

수많은 사용자가 함께 보는 실시간 상황판인데,
수시로 서버를 늘렸다 줄였다 해야 한다.

그 외, Private Push Notification 과 같은
메시지 전송이 보장되어야 하는 실시간 서비스

> 실시간 서비스를 개발하기 위한 서버 플랫폼

ACCESS Authentication

SESSION Control

DATA Storage

PUSH Notification

USER Management

DEVICE Management

socket.io

ZooKeeper™

redis

mongoDB

> 간단히 설치하여 사용할 수 있는 설치형 서버 플랫폼

개발자 프로토타입용으로 한번에 설치

```
> docker run stalk/xpush:standalone
```

XPUSH
SESSION

SERVER

XPUSH
CHANNEL
SERVER 1

XPUSH
CHANNEL
SERVER 2

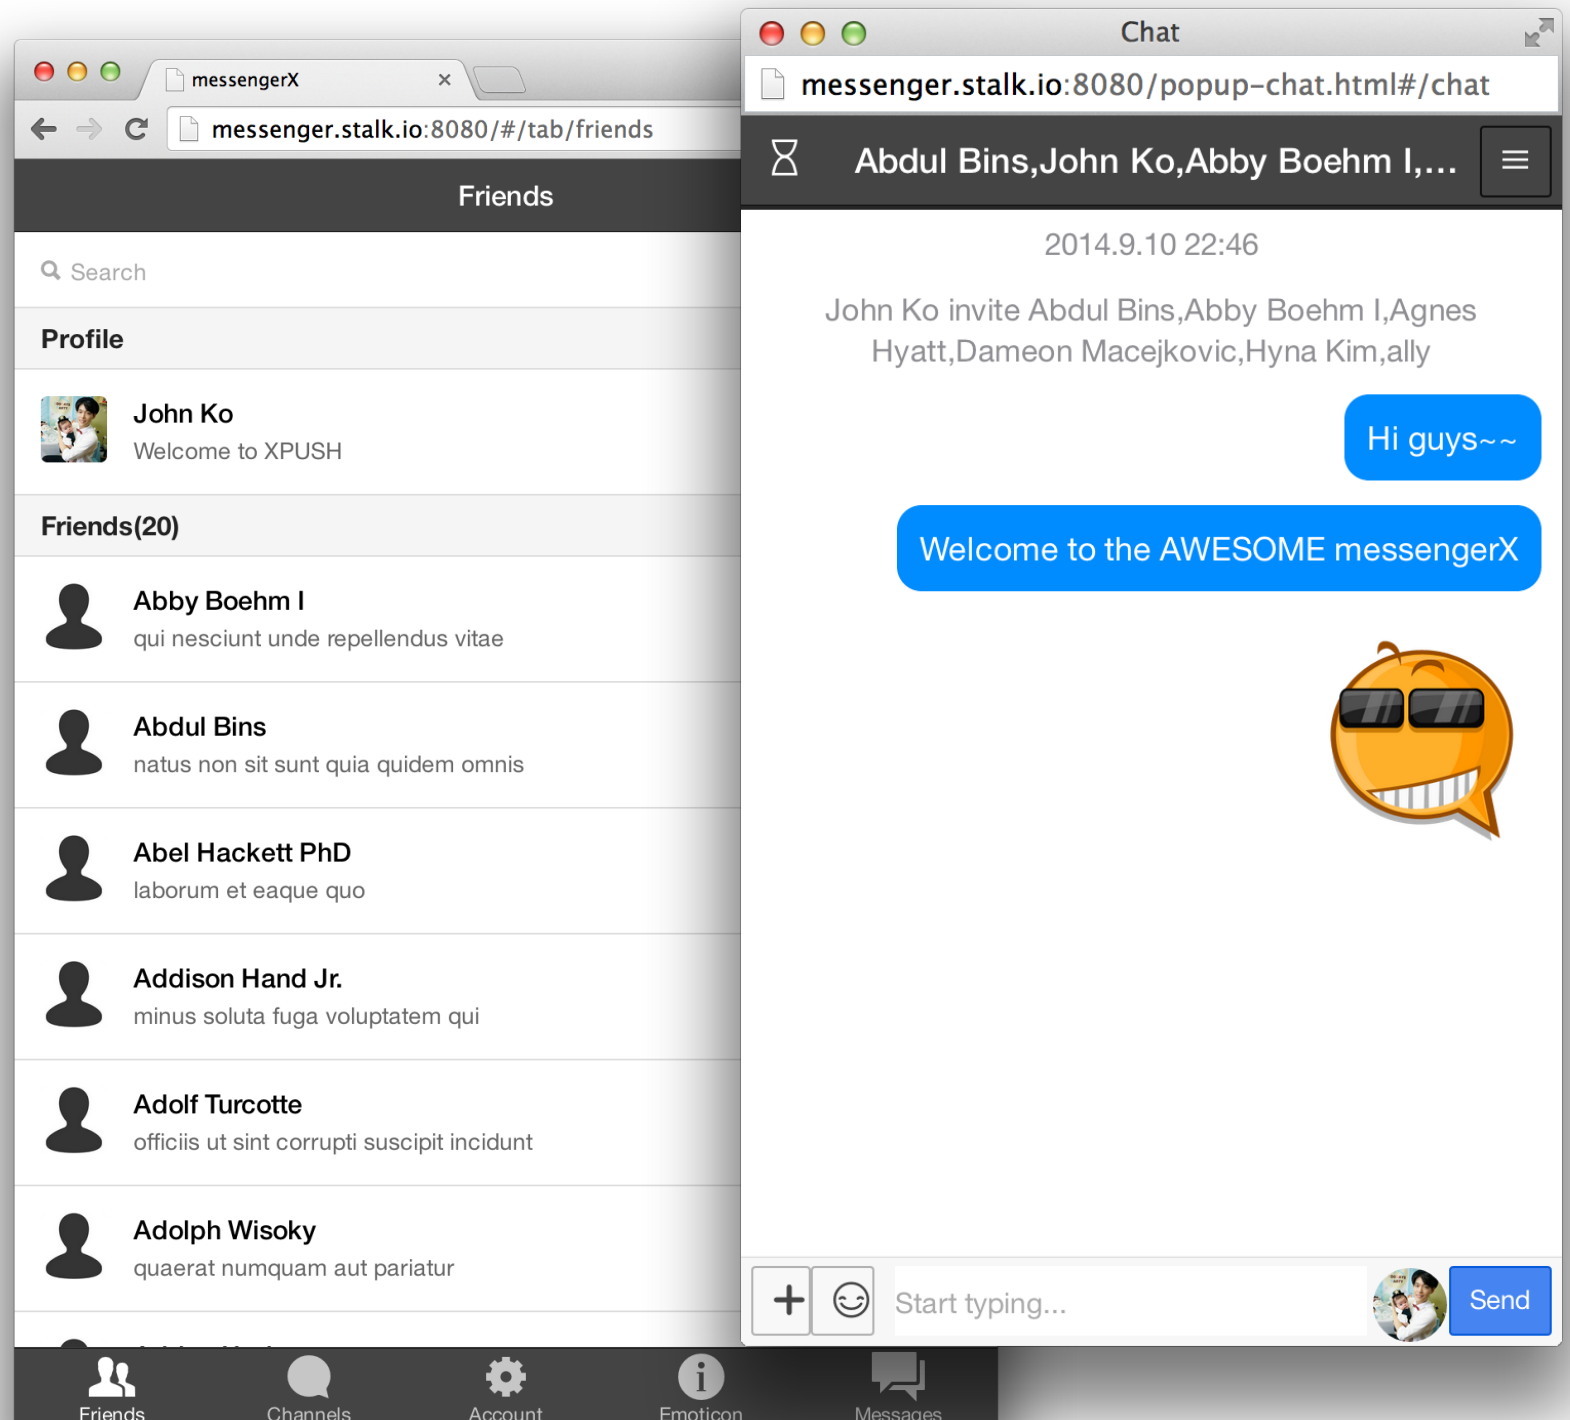

> Features

Works Everywhere

At the core of XPUSH is the HTML5 **WebSocket** protocol, but we also have **fallback mechanisms** so that XPUSH just works anywhere, anytime.

Windows / Linux / OSX
Web Browsers /
Android / IOS

> Features

Designed for developers

We help you **easily build real-time applications**. XPUSH was designed for developers.

Documentation about XPUSH

Updated: September 8, 2014.

We offers the documents of how to install, run and use the API of XPUSH.

Install the XPUSH platform to your local and server environment through this document, and let's start the development of various applications that leverage the XPUSH.

GETTING STARTED

And we will explain how to install the XPUSH and how to create a configuration file.

> Quick-start guide **recommended**

For your fastest experience for the XPUSH, you can make the simple application through sample by installing directly.

Please try to run the sample application by directly install the image file that is configured in the docker container.

> Installation

XPUSH use MongoDB, redis, and zookeeper to storage data and manage the real-time session and distributed environment. Before you install the XPUSH, first we will explain how to install this kind of open-source server.

And, we will explain how to install the XPUSH with npm(node package manager) or docker image.

> Configuration

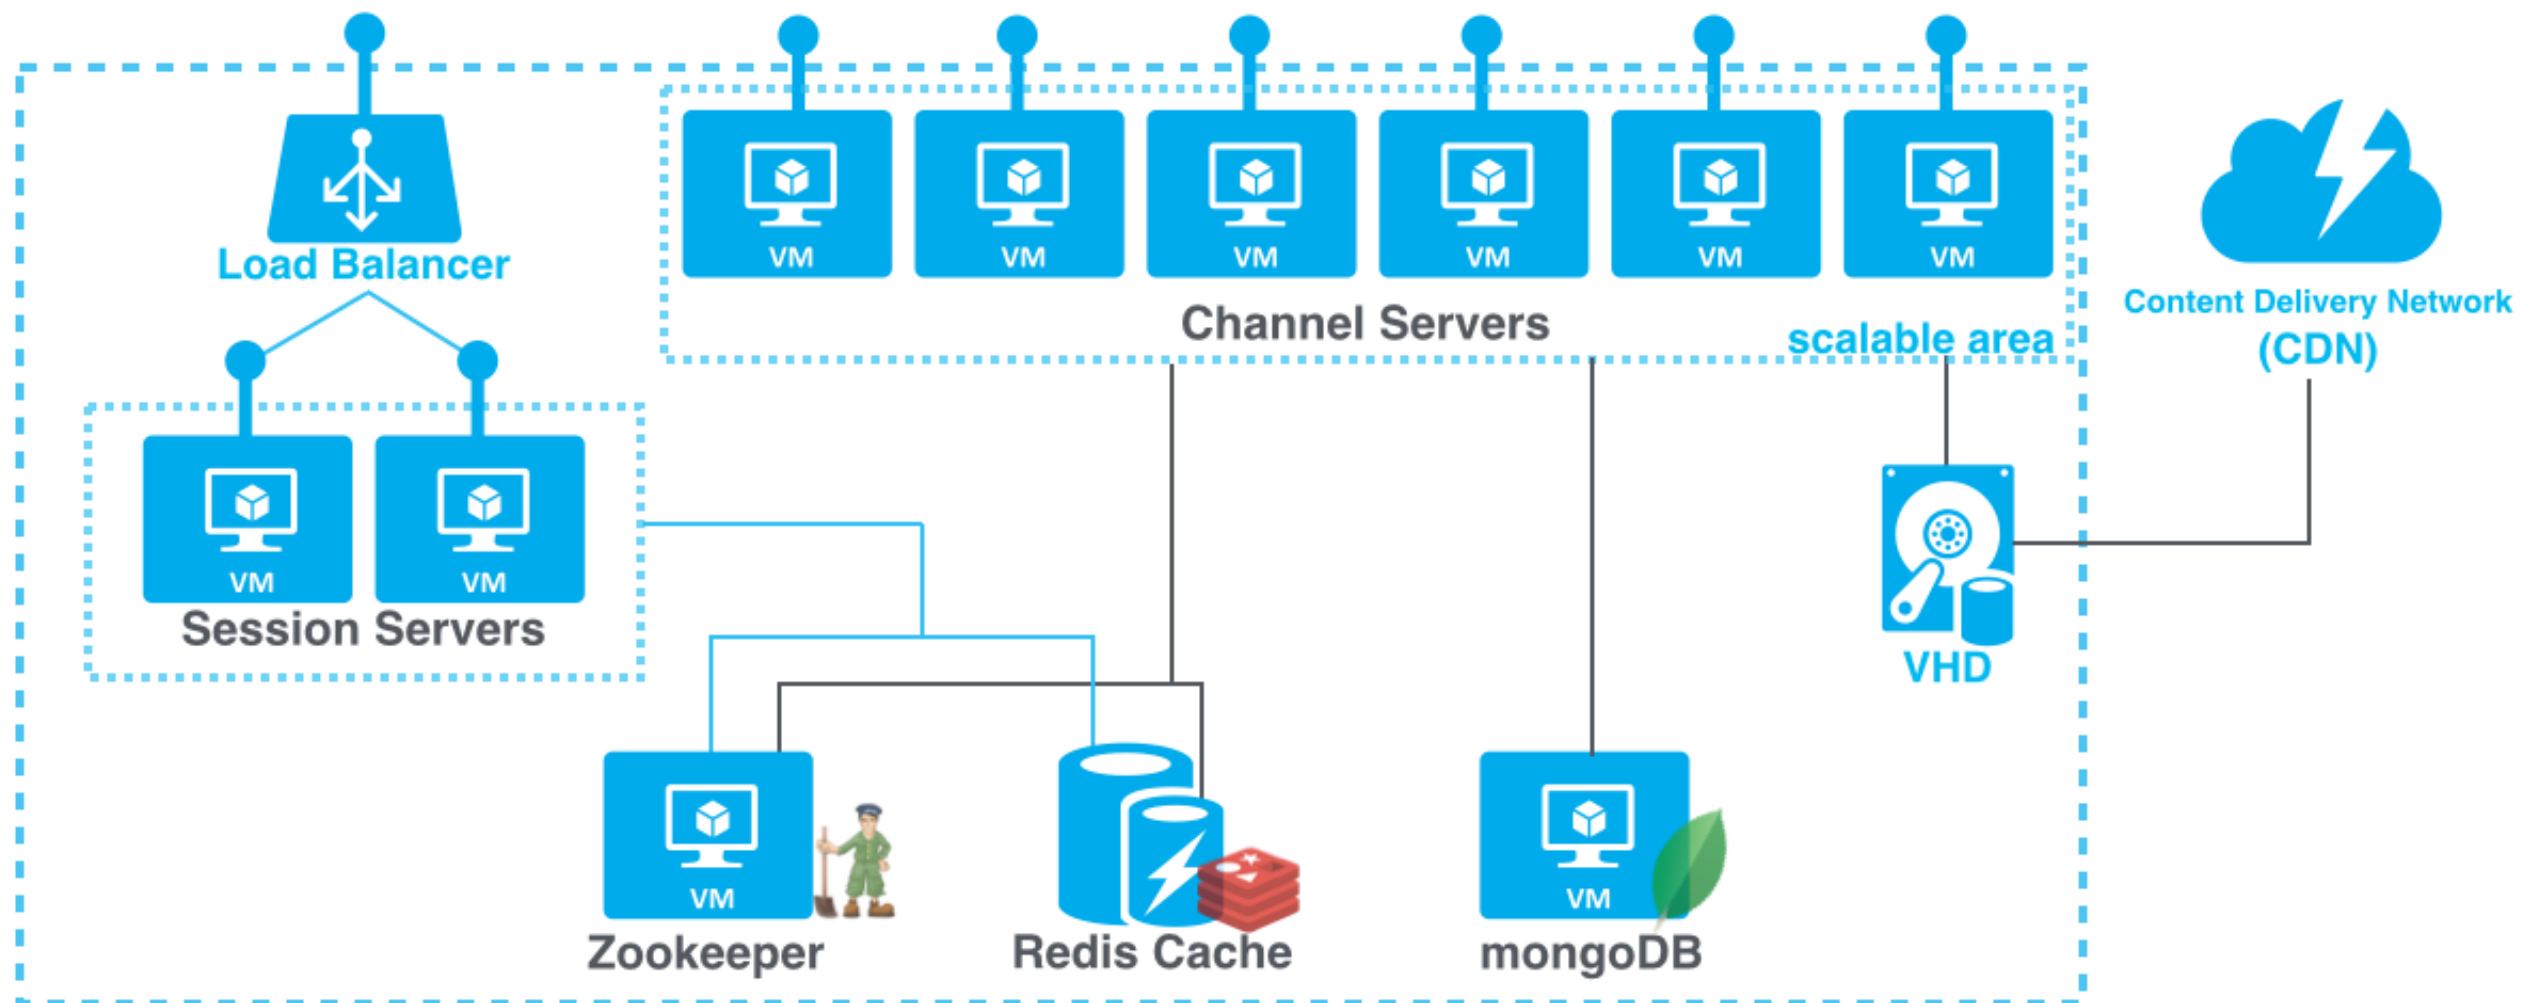

It describes the configuration parameters and how to create a configuration file in order to run the XPUSH.

API DOCUMENTS

➤ Features

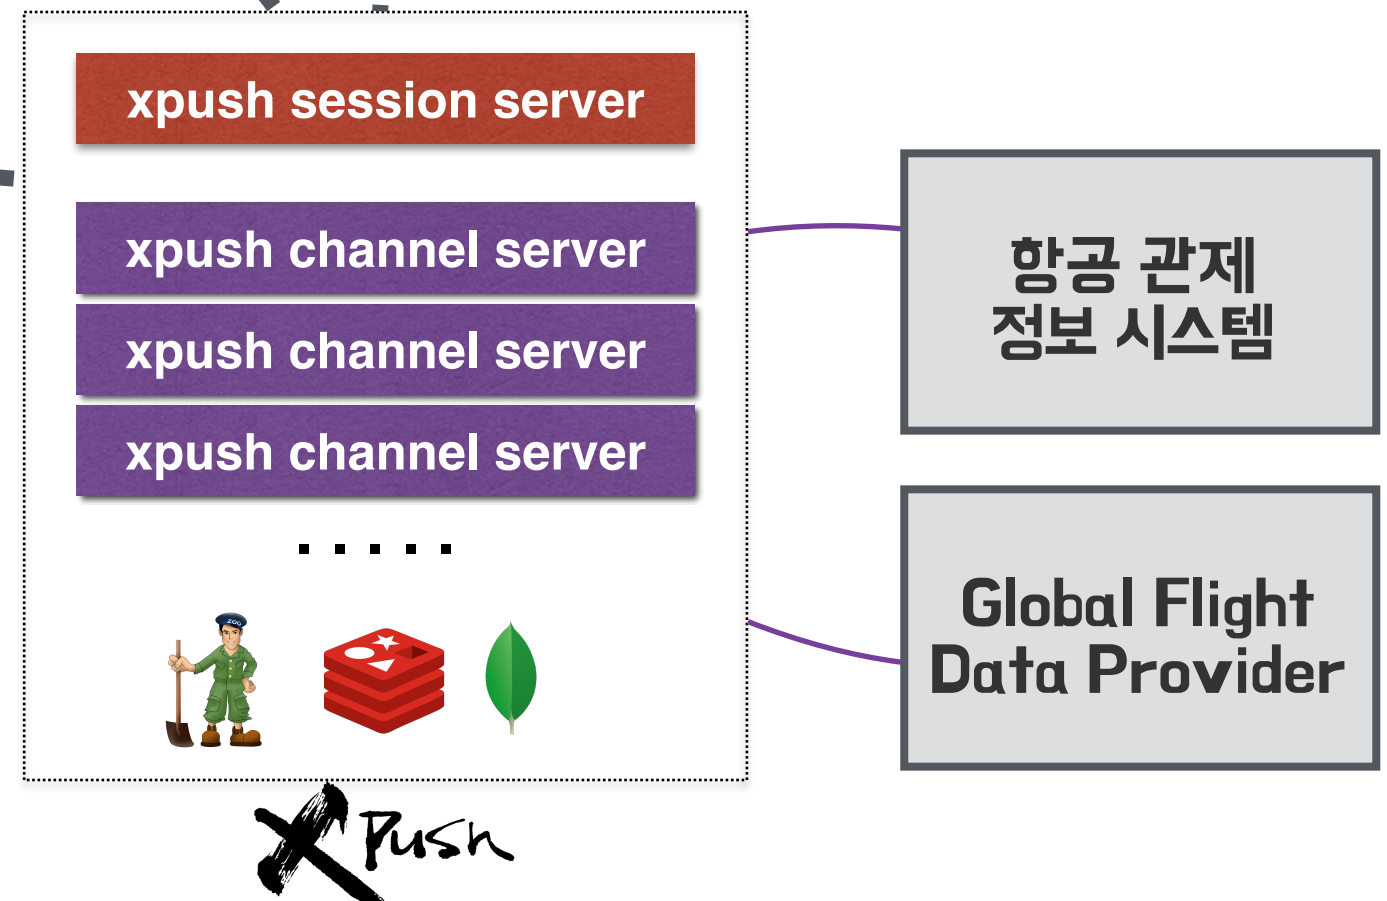

Scalable Web Architecture

XPUISH was designed to work with **commodity servers**, an elastic virtualised environments saving you money and headaches. **A scalable web application can handle growth – of users or work – without requiring changes to the source code and stoping existed servers.**

➤ 적용 예시

Advanced **FIDS** (Flight information display system)

> 적용 예시

정부민원포털, 정부민원콜센터 온라인 상담 서비스

고객센터로 전화 할때 (현재 서비스 되고 있음)

사용자 1

전화국

~~X~~ Push

CTI 에서
